

CABIN FILTER SPRAY

Wynn's® Cabin Filter Spray treats your cabin air filter with a pleasant, clean scent that provides you with the assurance of a clean air filter. A new cabin air filter treated with Wynn's® Cabin Filter Spray helps to combat unpleasant odors entering your vehicle's passenger cabin.

Wynn's® Cabin Filter Spray is part of a complete HVAC and Cabin Odor Control Service. See your Service Consultant about the benefits of a Wynn's® Aircomatic III™ service to combat mold, mildew, cigarette smoke and other unpleasant odors in your vehicle's interior and air handling system.

FEATURES & BENEFITS

- ✓ Combats Unpleasant Odors
- ✓ Provides a Fresh Scent from HVAC System
- ✓ Non-Flammable
- ✓ Non-Toxic
- ✓ Part of a Complete HVAC and Interior Odor Control Service

SPECIFICATIONS:

Product No: ZW30501

Net Weight: 0.4 FL OZ (12 mL)

Case Quantity: 24 Each

CABIN FILTER SPRAY

THE PROBLEM:

In many late model vehicles, outside air entering the passenger compartment must first pass through a cabin air filter. This filter is designed to trap contaminants like dirt, dust, pollen and, in some cases, bacteria and exhaust fumes. A cabin air filter can also prevent leaves, bugs and other debris from clogging the ventilation system.

A dirty or clogged cabin air filter can contribute to:

- Foul or Musty Odors in the Vents
- Compromised Air Quality
- Reduced Air Circulation in the Passenger Compartment
- Poor Window Defogging
- Diminished Performance from the HVAC System
- Increased Demand on System Components

Most manufactures recommend replacing the cabin air filter every 12 months or 12,000 miles. Heavy pollen, polluted air, dusty conditions and driving on dirt roads can all shorten the life of your cabin air filter leading to more frequent filter replacement.

The cabin air filter is tucked away, out of sight, and there's no warning gauge or light to let you know when it's time to replace or whether it has been replaced. Short of visually inspecting the cabin air filter after service, a vehicle owner has limited confirmation.

THE SOLUTION:

Replacing a dirty cabin air filter with a new, clean filter reduces the risk of contaminants in the air of your vehicle.

- Replacement of the cabin air filter, based on manufacturer's recommendations, can keep your HVAC system running efficiently.
- Using Wynn's® Cabin Filter Spray when replacing the air filter provides reassurance that the filter was replaced and adds a fresh, clean scent to your vehicle.

Directions:

- Remove the cover to expose the cabin air filter.
- Remove the used filter from the evaporator case or holder and discard.
- Remove the new cabin filter from packaging.
- Apply 6 – 12 pumps of Wynn's® Cabin Filter Spray evenly onto the inbound side of the cabin air filter.
- Start vehicle and let it run at idle.
- Set fan control speed setting to high.
- Turn recirculation mode on.
- Let vehicle run for 5 minutes to allow fragrance to permeate the filter.

NOTE: Safety glasses and gloves are recommended during the service. Use in a well-ventilated area.
