

# FUEL

## ETHANOL+

Wynn's® Ethanol+ is a revolutionary formulation that helps eliminate the water that accumulates in and contaminates both gasoline and diesel fuel systems. Gasoline and Diesel fuel tanks collect water year-round due to humid conditions or contamination of underground storage tanks. Ethanol blended fuels are highly hygroscopic which causes the fuel to absorb even more water. Excess water in fuel can lead to phase separation which can lower the octane number and may cause knocking in an engine.

This professional formula will stabilize both gasoline and diesel fuels, while also dissolving and suspending the water for removal through the combustion process. Ethanol+ guards metal surfaces in your vehicle from corrosion and helps prevent hesitation and poor acceleration caused by water contamination.

### FEATURES AND BENEFITS:

- ✓ Effective in All Blends of Ethanol Fuel
- ✓ Protects from Phase Separation
- ✓ Removes Water from Fuel Tank
- ✓ Fights Corrosion
- ✓ Helps Prevent Hesitation and Poor Acceleration
- ✓ For Use in All Gasoline and Diesel Fuels
- ✓ Prevents Thermal and Oxidative Breakdown during Storage

### SPECIFICATIONS:

Product No: ZW67411

Net Weight: 11 FL OZ (325 mL)

Case Quantity: 24 Each

# FUEL

## ETHANOL+

### THE PROBLEM:

- Undissolved water in the fuel tank can cause various performance problems, such as hesitation, sputtering, stalling, and even hydrostatic lock.
- Pockets and pools of water can cause corrosion in the fuel tank.
- Standard dry fuel products consist of methanol or isopropyl alcohol. These ingredients can help the solubility of small amounts of water, but if the amount of water in the fuel exceeds the ability of the alcohol to absorb it, phase separation occurs. The water in the bottom of the tank draws the alcohol out of the fuel, altering its combustion characteristics; and more importantly, if the water/alcohol mixture enters the fuel lines and is injected into the cylinders, it can cause catastrophic damage.

### THE SOLUTION:

- Wynn's® Ethanol+ dissolves and suspends small amounts of water in the fuel tank that is then carried into the combustion chamber and released through the exhaust.
- Wynn's® Ethanol+ includes corrosion protection that is proven to work in both gasoline and diesel. This professional product effectively stabilizes the fuel and protects metal surfaces if water is present.
- Wynn's® Ethanol+ does not rely upon an alkyl alcohol to absorb water; therefore, phase separation does not occur if the system is overloaded with water. Excess water simply falls to the bottom of the tank.

**Application and Treat Rate:** This product treats 30 gallons of gasoline or diesel fuel.

**Directions:** Add to fuel tank.

**Note:** Not intended to treat significant amounts of free water.
